

I debugged the chord display, I needed to move everything to be inside of the generateBtn.onclick. I also sometimes called my button variable wrong. Then I made it so that the chords are randomized. Because my base progression is 4 chords, when I selected 8 chords, it just repeated the same 4 chords twice in the same order. I added all 12 major keys so that the user can regenerate the chord progression until they like it. Because each chord is generated from the curated set for each genre, it still sounds musical despite the randomness.

I added a play all button, and had to keep adjusting when the chords resolve until the sounds were no longer overlapping.

Then, I had to make it so that if I generate a 3 chord progression, the program won't make all 3 chords the same. So if all are the same, it quickly regenerates until they are not.
